

Contoh Kode Laravel Rapi

Implementasi ItemController yang menerapkan prinsip Clean Code dan Service Pattern.

ItemController.php

```
namespace App\Http\Controllers;

use App\Http\Requests\StoreItemRequest;
use App\Models\Item;
use App\Models\Category;
use App\Services\InventoryService;
use Illuminate\Http\RedirectResponse;
use Illuminate\View\View;

class ItemController extends Controller
{
    protected InventoryService $inventoryService;

    public function __construct(InventoryService $inventoryService)
    {
        $this->inventoryService = $inventoryService;
    }

    public function index(): View
    {
        Category::firstOrCreate(['name' => 'General Electronics']);
        $items = Item::with('category')->latest()->get();
        return view('inventory', compact('items'));
    }

    public function store(StoreItemRequest $request): RedirectResponse
    {
        $this->inventoryService->createItem($request->validated());
        return redirect('/')->with('success', 'Barang berhasil ditambahkan.');
```
